Public events "NewControl demonstrators for Autonomous driving"

In the last months of the project, NewControl organized two public events to present the project-related demonstrators. The first event was organized on the 15th of February 2023 in Finland, and the second – on the 16th of March in Italy.

The main goal of these events was to bring awareness about the developed technologies to the project-related stakeholders, to inform and introduce the audience to the holistic approach to highly automated vehicles, and to provide a possibility to the general public to try high-level autonomous technologies.

In the first event, all visitors had the possibility to explore demonstrators developed by Finnish partners: UNIKIE Autonomous Vehicle, North Finding Device, Laser Scanning Microelectromechanical System, MEMS Accelerometer, In-plane Piezoelectric Cantilever Demonstrator, CiThruS2 Simulation Framework, etc.

In the second event, visitors had a chance to explore Danisi Engineering's static and dynamic driving simulators and many other demonstrators developed by Italian partners (Fail operational Platform, Fail-operational ECU through Redundant Architecture, Fail-operational Autonomous Vehicle (Maserati Levante), HV Battery System, etc). With this and future similar events, we want to increase the awareness of future mobility to achieve the natural trust of the end-users.
